LNG Supply, Trade and Contracting Patterns:
Is Transformation Happening?

Michelle Michot Foss
Chief Energy Economist and Head/Program Manager

Miranda L. Ferrell Wainberg
Advisor

Gürcan Gülen
Senior Energy Economist/Research Scientist

Dmitry Volkov
Business Development Manager, Intercontact Corporation

This paper was prepared by researchers at the Bureau of Economic Geology’s Center for Energy Economics, Jackson School of Geosciences, The University of Texas. It originated with an AIPN grant won by Svetlana Ikonnikova and Dmitry Volkov (then an energy analyst at BEG/CEE) in 2009. Steven Miles and Thomas Holmberg of Baker Botts and John Bowman of King & Spalding provided significant comments and critique. CEE researchers participated in the AIPN Master Sale and Purchase Agreement (MSA) model contract committee created in 2005 and led by Harry Sullivan and Steven Miles. In 2007 CEE hosted a committee meeting with industry operators to address technical issues in the MSA. The model contract documents were approved by the AIPN board in 2009. Information on the MSA is available from AIPN, [www.aipn.org](http://www.aipn.org). Committee discussions and exchanges associated with the model MSA and on short term or “spot” LNG transactions generally, as well as AIPN document development, contributed invaluable insights to the evolution of global LNG trade. Finally, CEE benefits from funding support and ongoing interactions with a host of domestic and international energy companies and other organizations. Donors to CEE’s LNG research and public education consortium, Commercial Frameworks for LNG in North America, which operated from 2002-2009 have been particularly helpful over the years in sharing information, access to facilities, time, and energy to our continued efforts. All of CEE’s donors and peer review organizations are listed on our LNG web site, [www.beg.utexas.edu/energyecon/lng](http://www.beg.utexas.edu/energyecon/lng).

At the time this paper was finalized and released by AIPN, the LNG industry was facing a new round of challenges. Demand for LNG following the 2010 earthquake and tsunami in Japan, and the subsequent events at the Fukushima Daiichi nuclear facility, provided relief for a global business that was in surplus. The 2000s buildup of LNG industry capacity on all fronts – export liquefaction, shipping, and import receiving/regasification – had collided with 2009 recession effects to create considerable drag on utilization rates and profitability. But the “black swan” effects post-Fukushima unfolded in the face of another reality that already was permeating through the industry – the desire by many customers for different contract terms. In particular, the traditional oil-based pricing mechanism for LNG increasingly has been questioned. Production gains in the U.S. and consequent erosion of the U.S. Henry Hub natural gas price signal has only exacerbated the extent to which oil-indexed LNG represents a substantial premium. Many views, including ours, are that fundamental shifts in LNG contract pricing formulas, indeed many long-term natural gas supply and purchase agreements, could lie ahead. Much rests on forward expectations about oil prices and the oil-to-natural gas price “spread”. However, given the pervasive and persistent recession effects in Europe and erosion of economic performance in large LNG-buying countries like India it is clear that many customers in price sensitive locations could benefit substantially from natural gas-linked price formulas. The rapid progression of changing conditions over the past 10-15 years, and indications of additional challenges to come, will ensure that the LNG industry remains interesting!
Table of Contents
1 EXECUTIVE SUMMARY ........................................................................................................... 5
2 INTRODUCTION ....................................................................................................................... 6
3 LNG INDUSTRY AND TRADE ORGANIZATION OVERVIEW: PRODUCERS, BUYERS, AND TRANSPORTERS ................................................................. 11
  3.1 Atlantic Basin .................................................................................................................... 12
  3.2 Pacific Basin ..................................................................................................................... 20
  3.3 Flexible LNG Exporters .................................................................................................... 24
  3.4 Summary and Conclusions .............................................................................................. 27
4 THE LNG VALUE CHAIN: TECHNOLOGIES AND COSTS .................................................... 29
  4.1 Natural Gas Exploration and Production (Upstream) ....................................................... 31
  4.2 LNG Liquefaction .......................................................................................................... 32
  4.3 LNG Shipping ................................................................................................................... 35
  4.4 LNG Regasification ......................................................................................................... 37
  4.5 Value Chain Costs: Contracting Implications ................................................................. 39
  4.6 Summary and Conclusions .............................................................................................. 39
5 REGIONAL LNG PRICE DIFFERENCES AND THE EMERGENCE OF PRICE ARBITRAGE AND SHORT-TERM LNG TRADING ............................................ 40
  5.1 Regional LNG Price Differences ...................................................................................... 40
  5.2 LNG Contracting, Price Arbitrage and Destination Flexibility ....................................... 49
  5.3 Summary and Conclusions .............................................................................................. 53
6 POSSIBLE “GAME CHANGERS” FOR THE FUTURE .................................................................. 53
7 SUMMARY AND CONCLUSIONS ............................................................................................... 63
8 REFERENCES (CITED AND BACKGROUND) ............................................................................ 65
